Arity/Signature

**This talk:** give a *discipline* for specifying syntaxes

# Motivating example: dLC

syntax of dLC = **differential  $\lambda$ -calculus** [Ehrhard-Regnier 2003].

- explicitly involves **equations**      e.g.  $s+t = t+s$
- specifically tailored: (not an *instance* of a general framework/scheme)  
inductive definition of a set      +      ad-hoc structure  
e.g. **unary substitution**

**Our proposal** = a discipline for presenting syntaxes

- signature = operations + equations
- [Fiore-Hure 2010]: alternative approach, for simply typed syntaxes  
 $\Rightarrow$  our approach explicitly relies on monads and modules (untyped case).

# Syntax of dLC: [Ehrhard-Regnier 2003]

Let be given a denumerable set of variables. We define by induction on  $k$  an increasing family of sets  $(\Delta_k)$ . We set  $\Delta_0 = \emptyset$  and  $\Delta_{k+1}$  is defined as follows.

*Monotonicity:* if  $t$  belongs to  $\Delta_k$  then  $t$  belongs to  $\Delta_{k+1}$ .

*Variable:* if  $n \in \mathbb{N}$ ,  $x$  is a variable,  $i_1, \dots, i_n \in \mathbb{N}^+ = \mathbb{N} \setminus \{0\}$  and  $u_1, \dots, u_n \in \Delta_k$ , then

$$D_{i_1, \dots, i_n} x \cdot (u_1, \dots, u_n)$$

belongs to  $\Delta_{k+1}$ . This term is identified with all the terms of the shape  $D_{i_{\sigma(1)}, \dots, i_{\sigma(n)}} x \cdot (u_{\sigma(1)}, \dots, u_{\sigma(n)}) \in \Delta_{k+1}$  where  $\sigma$  is a permutation on  $\{1, \dots, n\}$ .

*Abstraction:* if  $n \in \mathbb{N}$ ,  $x$  is a variable,  $u_1, \dots, u_n \in \Delta_k$  and  $t \in \Delta_k$ , then

$$D_1^n \lambda x t \cdot (u_1, \dots, u_n)$$

belongs to  $\Delta_{k+1}$ . This term is identified with all the terms of the shape  $D_1^n \lambda x t \cdot (u_{\sigma(1)}, \dots, u_{\sigma(n)}) \in \Delta_{k+1}$  where  $\sigma$  is a permutation on  $\{1, \dots, n\}$ .

*Application:* if  $s \in \Delta_k$  and  $t \in R\langle \Delta_k \rangle$ , then

$$(s)t$$

belongs to  $\Delta_{k+1}$ .

Setting  $n=0$  in the first two clauses, and restricting application by the constraint that  $t \in \Delta_k \subseteq R\langle \Delta_k \rangle$ , one retrieves the usual definition of lambda-terms which shows that differential terms are a superset of ordinary lambda-terms.

The permutative identification mentioned above will be called *equality up to differential permutation*. We also work up to  $\alpha$ -conversion.

# Syntax of dLC: [Ehrhard-Regnier 2003]

Let be given a denumerable set of variables. We define by induction on  $k$  an increasing family of sets  $(\Delta_k)$ . We set  $\Delta_0 = \emptyset$  and  $\Delta_{k+1}$  is defined as follows.

*Monotonicity:* if  $t$  belongs to  $\Delta_k$  then  $t$  belongs to  $\Delta_{k+1}$ .

*Variable:* if  $n \in \mathbb{N}$ ,  $x$  is a variable,  $i_1, \dots, i_n \in \mathbb{N}^+ = \mathbb{N} \setminus \{0\}$  and  $u_1, \dots, u_n \in \Delta_k$ , then

$$D_{i_1, \dots, i_n} x \cdot (u_1, \dots, u_n)$$

belongs to  $\Delta_{k+1}$ . This term is identified with all the terms of the shape  $D_{i_{\sigma(1)}, \dots, i_{\sigma(n)}} x \cdot (u_{\sigma(1)}, \dots, u_{\sigma(n)}) \in \Delta_{k+1}$  where  $\sigma$  is a permutation on  $\{1, \dots, n\}$ .

*Abstraction:* if  $n \in \mathbb{N}$ ,  $x$  is a variable,  $u_1, \dots, u_n \in \Delta_k$  and  $t \in \Delta_k$ , then

$$D_1^n \lambda x t \cdot (u_1, \dots, u_n)$$

belongs to  $\Delta_{k+1}$ . This term is identified with all the terms of the shape  $D_1^n \lambda x t \cdot (u_{\sigma(1)}, \dots, u_{\sigma(n)}) \in \Delta_{k+1}$  where  $\sigma$  is a permutation on  $\{1, \dots, n\}$ .

*Application:* if  $s \in \Delta_k$  and  $t \in R\langle \Delta_k \rangle$ , then

$$(s)t \leftarrow \text{as an operation: } \Lambda \times \text{FreeCommutativeMonoid}(\Lambda) \rightarrow \Lambda$$

belongs to  $\Delta_{k+1}$ .

Setting  $n=0$  in the first two clauses, and restricting application by the constraint that  $t \in \Delta_k \subseteq R\langle \Delta_k \rangle$ , one retrieves the usual definition of lambda-terms which shows that differential terms are a superset of ordinary lambda-terms.

The permutative identification mentioned above will be called equality up to differential permutation. We also work up to  $\alpha$ -conversion.

# Syntax of dLC: [BEM 2010]

A **syntax** for the ***differential  $\lambda$ -calculus*** by ***mutual induction***:

[Bucciarelli-Ehrhard-Manzonetto 2010]

***Simple terms:***

$$\Lambda^s : \quad s, t \quad ::= \quad x \mid \lambda x. s \mid sT \mid D s \cdot t$$

***Differential  $\lambda$ -terms:***

$$\Lambda^d : \quad T \quad ::= \quad 0 \mid s \mid s + T$$

# Syntax of dLC: [BEM 2010]

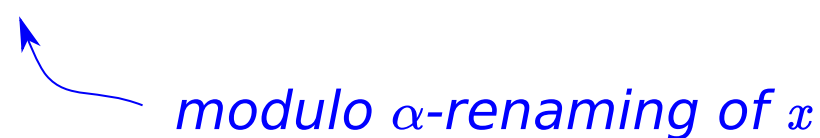

A **syntax** for the **differential  $\lambda$ -calculus** by **mutual induction**:

[Bucciarelli-Ehrhard-Manzonetto 2010]

**Simple terms:**

$$\Lambda^s : \quad s, t \quad ::= \quad x \mid \lambda x. s \mid sT \mid Ds \cdot t$$

**Differential  $\lambda$ -terms:**

$$\Lambda^d : \quad T \quad ::= \quad 0 \mid s \mid s + T$$

*modulo  $\alpha$ -renaming of  $x$*

# Syntax of dLC: [BEM 2010]

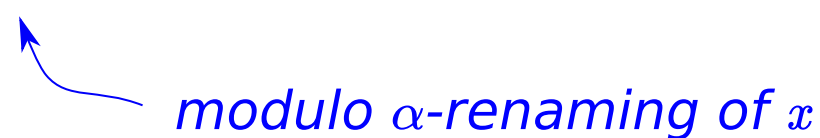

A **syntax** for the **differential  $\lambda$ -calculus** by **mutual induction**:

[Bucciarelli-Ehrhard-Manzonetto 2010]

**Simple terms:**

$$\Lambda^s : \quad s, t \quad ::= \quad x \mid \lambda x. s \mid sT \mid D s \cdot t$$

**Differential  $\lambda$ -terms:**

$$\Lambda^d : \quad T \quad ::= \quad 0 \mid s \mid s + T$$

$$\Lambda^d = \mathbf{FreeCommutativeMonoid}(\Lambda^s)$$

# Syntax of dLC: [BEM 2010]

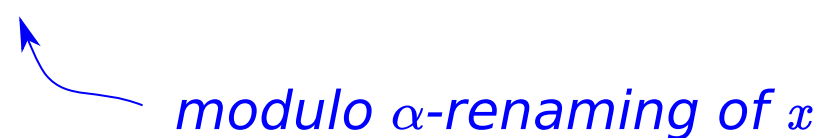

A **syntax** for the **differential  $\lambda$ -calculus** by **mutual induction**:

[Bucciarelli-Ehrhard-Manzonetto 2010]

**Simple terms:**

$$\Lambda^s : \quad s, t \quad ::= \quad x \mid \lambda x. s \mid sT \mid Ds \cdot t$$

**Differential  $\lambda$ -terms:**

$$\Lambda^d : \quad T \quad ::= \quad 0 \mid s \mid s + T$$

*modulo  $\alpha$ -renaming of  $x$*

*neutral element for  $+$*

*modulo commutativity*

$$\Lambda^d = \mathbf{FreeCommutativeMonoid}(\Lambda^s)$$

Syntax: specified by operations and **equations**.

# Syntax of dLC: [BEM 2010]

A **syntax** for the **differential  $\lambda$ -calculus** by **mutual induction**:

[Bucciarelli-Ehrhard-Manzonetto 2010]

**Simple terms:**

$$\Lambda^s : \quad s, t \quad ::= \quad x \mid \lambda x. s \mid sT \mid Ds \cdot t$$

*variable* (arrow from  $x$  to  $\lambda x. s$ )

**Differential  $\lambda$ -terms:**

$$\Lambda^d : \quad T \quad ::= \quad 0 \mid s \mid s + T$$

*modulo  $\alpha$ -renaming of  $x$*  (arrow from  $\lambda x. s$  to  $s$ )

*neutral element for  $+$*  (arrow from  $0$  to  $s + T$ )

*modulo commutativity* (arrow from  $s + T$  to  $s + T$ )

$$\Lambda^d = \mathbf{FreeCommutativeMonoid}(\Lambda^s)$$

Syntax: specified by operations and **equations**.

But which ones are allowed ? What is the limit ?

# Syntax of dLC: Our version

**Which operations/equations are allowed to specify a syntax ?**

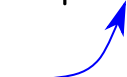

**A stand-alone presentation of differential  $\lambda$ -terms:**

Allow sums everywhere (not only in the right arg of application)

*Differential  $\lambda$ -terms:*

$$\Lambda^d : S, T ::= x \mid \lambda x. S \mid S T \mid D S \cdot T$$

$$\mid 0 \mid S + T$$

*neutral element for +*  *modulo commutativity and associativity* 

Macros in [BEM 2010]:

$$\lambda x. \Sigma_i t_i := \Sigma_i \lambda x. t_i$$

$$(\Sigma_i t_i) u := \Sigma_i t_i u$$

$$D(\Sigma_i t_i) \cdot (\Sigma_j u_j) := \Sigma_i \Sigma_j D t_i \cdot u_j$$

# Syntax of dLC: Conclusion

How can we compare these different versions ?

In which sense are they syntaxes ?

Which operations/equations are we allowed to specify in a syntax ?

# Syntax of dLC: Conclusion

# Substitution and monads

**Example:** differential  $\lambda$ -calculus

$$\Lambda^d : S, T ::= x \mid \lambda x. S \mid S T \mid DS \cdot T \\ \mid 0 \mid S + T$$

**Free variable indexing:**

$$dLC : X \mapsto \{\text{terms taking free variables in } X\}$$

$$dLC(\emptyset) = \{0, \lambda z.z, \dots\}$$

$$dLC(\{x, y\}) = \{0, \lambda z.z, \dots, x, y, x + y, \dots\}$$

# Substitution and monads

**Example:** differential  $\lambda$ -calculus

$$\Lambda^d : \quad S, T \quad ::= \quad x \mid \lambda x. S \mid S T \mid DS \cdot T \\ \mid 0 \mid S + T$$

**Free variable indexing:**

$$dLC : X \mapsto \{\text{terms taking free variables in } X\}$$

$$dLC(\emptyset) = \{0, \lambda z.z, \dots\}$$

$$dLC(\{x, y\}) = \{0, \lambda z.z, \dots, x, y, x + y, \dots\}$$

**Parallel substitution:**

$$t \quad \mapsto \quad t[\mathbf{x} \mapsto \mathbf{f}(\mathbf{x})]$$

# Substitution and monads

**Example:** differential  $\lambda$ -calculus

$$\Lambda^d : \quad S, T \quad ::= \quad x \mid \lambda x. S \mid S T \mid DS \cdot T \\ \mid 0 \mid S + T$$

**Free variable indexing:**

$$dLC : X \mapsto \{\text{terms taking free variables in } X\}$$

$$dLC(\emptyset) = \{0, \lambda z.z, \dots\}$$

$$dLC(\{x, y\}) = \{0, \lambda z.z, \dots, x, y, x + y, \dots\}$$

**Parallel substitution:**

$$\begin{array}{ll} \text{bind}_f : dLC(X) \rightarrow dLC(Y) & \text{where } f : X \rightarrow dLC(Y) \\ t \mapsto t[x \mapsto f(x)] \end{array}$$

$\Rightarrow (dLC, \text{var}_X : X \subset dLC(X), \text{bind}) = \mathbf{monad \ on \ Set}$

# Substitution and monads

**Example:** differential  $\lambda$ -calculus

$$\Lambda^d : \quad S, T \quad ::= \quad x \mid \lambda x. S \mid S T \mid DS \cdot T \\ \mid 0 \mid S + T$$

**Free variable indexing:**

$$dLC : X \mapsto \{\text{terms taking free variables in } X\}$$

$$dLC(\emptyset) = \{0, \lambda z.z, \dots\}$$

$$dLC(\{x, y\}) = \{0, \lambda z.z, \dots, x, y, x + y, \dots\}$$

**Parallel substitution:**

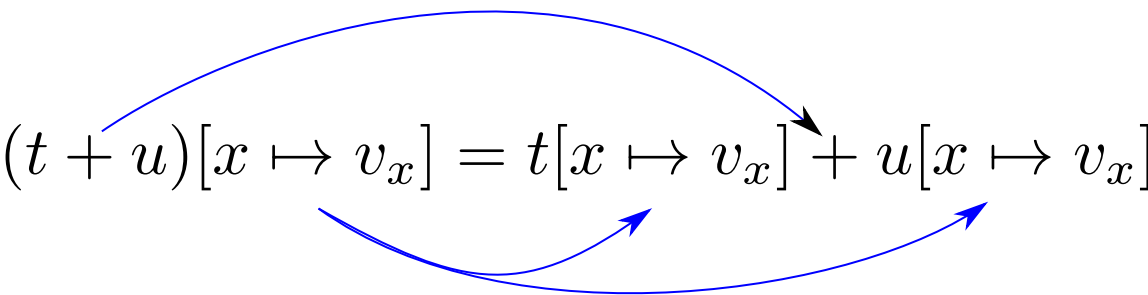

$$\begin{array}{ll} \text{bind}_f : dLC(X) \rightarrow dLC(Y) & \text{where } f : X \rightarrow dLC(Y) \\ t \mapsto t[x \mapsto f(x)] \end{array}$$

$\Rightarrow (dLC, \text{var}_X : X \subset dLC(X), \text{bind}) = \mathbf{monad \ on \ Set}$

**monad morphism** = mapping preserving variables and substitutions.

# Preview: Operations are module morphisms

+ commutes with substitution

$$(t + u)[x \mapsto v_x] = t[x \mapsto v_x] + u[x \mapsto v_x]$$

## Categorical formulation

$dLC \times dLC$  supports  
 $dLC$ -substitution

$dLC \times dLC$  is a **module over  $dLC$**

+ commutes  
with substitution

$+ : dLC \times dLC \rightarrow dLC$  is a  
**module morphism**

# Building blocks for specifying operations

Essential constructions of **modules over a monad**  $R$ :

- $R$  itself

- $M \times N$  for any modules  $M$  and  $N$

e.g.  $R \times R$ :  $f: X \rightarrow R(Y)$

$$(t, u)[x \mapsto f(x)] := (t[x \mapsto f(x)], u[x \mapsto f(x)])$$

- $M' = \mathbf{derivative\ of\ a\ module}\ M$ :  $M'(X) = M(X \coprod \{\diamond\})$ .

disjoint union  
fresh variable

used to model an operation binding a variable (Cf next slide).

# Syntactic operations are module morphisms

**operations = module morphisms** = maps commuting with substitution.

$$0 : 1 \rightarrow \text{dLC}$$

$$\text{app} : \text{dLC} \times \text{dLC} \rightarrow \text{dLC}$$

$$+ : \text{dLC} \times \text{dLC} \rightarrow \text{dLC}$$

$$\text{abs} : \text{dLC}' \rightarrow \text{dLC}$$

$$\text{abs}_X : \text{dLC}(X \coprod_t \{\diamond\}) \rightarrow \text{dLC}(X)$$
$$\quad \quad \quad \mapsto \lambda \diamond. t$$

# Syntactic operations are module morphisms

**operations = module morphisms** = maps commuting with substitution.

$$0 : 1 \rightarrow \text{dLC}$$

$$\text{app} : \text{dLC} \times \text{dLC} \rightarrow \text{dLC}$$

$$+ : \text{dLC} \times \text{dLC} \rightarrow \text{dLC}$$

$$\text{abs} : \text{dLC}' \rightarrow \text{dLC}$$

$$\text{abs}_X : \text{dLC}(X \coprod_t \{\diamond\}) \rightarrow \text{dLC}(X)$$

$\quad \quad \quad \mapsto \lambda \diamond. t$

**Combining operations into a single one using disjoint union**

$$[0, +] : 1 \coprod (\text{dLC} \times \text{dLC}) \rightarrow \text{dLC}$$

$$[\text{app}, \text{abs}] : (\text{dLC} \times \text{dLC}) \coprod \text{dLC}' \rightarrow \text{dLC}$$

# Syntactic operations are module morphisms

**operations = module morphisms** = maps commuting with substitution.

$$0 : 1 \rightarrow \text{dLC}$$

$$\text{app} : \text{dLC} \times \text{dLC} \rightarrow \text{dLC}$$

$$+ : \text{dLC} \times \text{dLC} \rightarrow \text{dLC}$$

$$\text{abs} : \text{dLC}' \rightarrow \text{dLC}$$

# 1-signatures and their models

A **1-signature**  $\Sigma$  = functorial assignment:

$$R \mapsto \Sigma(R)$$

**Example:**  $(0, +)$

$$\Sigma_{0,+}(R) = 1 \coprod (R \times R)$$

A **model of  $\Sigma$**  is a pair:

$$(R, \rho : \Sigma(R) \rightarrow R)$$

**dLC** = model of  $\Sigma_{0,+}$

$$[0, +] : 1 \coprod (dLC \times dLC) \rightarrow dLC$$

A **model morphism**  $m : (R, \rho) \rightarrow (S, \sigma)$  = monad morphism commuting with the module morphism:

$$\begin{array}{ccc} \Sigma(R) & \xrightarrow{\rho} & R \\ \Sigma(m) \downarrow & & \downarrow m \\ \Sigma(S) & \xrightarrow{\sigma} & S \end{array}$$

# 1-signatures and their models

A **1-signature**  $\Sigma$  = functorial assignment:

$$R \mapsto \Sigma(R)$$

monad

A **model of  $\Sigma$**  is a pair:

$$(R, \rho : \Sigma(R) \rightarrow R)$$

**Example:**  $(0, +)$

$$\Sigma_{0,+}(R) = 1 \coprod (R \times R)$$

**dLC** = model of  $\Sigma_{0,+}$

$$[0, +] : 1 \coprod (dLC \times dLC) \rightarrow dLC$$

A **model morphism**  $m : (R, \rho) \rightarrow (S, \sigma) =$  monad morphism commuting with the module morphism:

$$\begin{array}{ccc} \Sigma(R) & \xrightarrow{\rho} & R \\ \Sigma(m) \downarrow & & \downarrow m \\ \Sigma(S) & \xrightarrow{\sigma} & S \end{array}$$

# 1-signatures and their models

A **1-signature**  $\Sigma$  = functorial assignment:

$$R \mapsto \Sigma(R)$$

monad  $\quad$  module over  $R$

A **model of  $\Sigma$**  is a pair:

$$(R, \rho : \Sigma(R) \rightarrow R)$$

**Example:**  $(0, +)$

$$\Sigma_{0,+}(R) = 1 \coprod (R \times R)$$

**dLC** = model of  $\Sigma_{0,+}$

$$[0, +] : 1 \coprod (dLC \times dLC) \rightarrow dLC$$

A **model morphism**  $m : (R, \rho) \rightarrow (S, \sigma)$  = monad morphism commuting with the module morphism:

$$\begin{array}{ccc} \Sigma(R) & \xrightarrow{\rho} & R \\ \Sigma(m) \downarrow & & \downarrow m \\ \Sigma(S) & \xrightarrow{\sigma} & S \end{array}$$

# 1-signatures and their models

A **1-signature**  $\Sigma$  = functorial assignment:

$$R \mapsto \Sigma(R)$$

monad  $\nearrow$   $\nwarrow$  module over  $R$

A **model of  $\Sigma$**  is a pair:

$$(R, \rho : \Sigma(R) \rightarrow R)$$

monad  $\nearrow$

**Example:**  $(0, +)$

$$\Sigma_{0,+}(R) = 1 \coprod (R \times R)$$

**dLC** = model of  $\Sigma_{0,+}$

$$[0, +] : 1 \coprod (dLC \times dLC) \rightarrow dLC$$

A **model morphism**  $m : (R, \rho) \rightarrow (S, \sigma) =$  monad morphism commuting with the module morphism:

$$\begin{array}{ccc} \Sigma(R) & \xrightarrow{\rho} & R \\ \Sigma(m) \downarrow & & \downarrow m \\ \Sigma(S) & \xrightarrow{\sigma} & S \end{array}$$

# 1-signatures and their models

A **1-signature**  $\Sigma$  = functorial assignment:

$$R \mapsto \Sigma(R)$$

monad  $\nearrow$   $\nwarrow$  module over  $R$

A **model of  $\Sigma$**  is a pair:

$$(R, \rho : \Sigma(R) \rightarrow R)$$

monad  $\nearrow$   $\nwarrow$  module morphism

**Example:**  $(0, +)$

$$\Sigma_{0,+}(R) = 1 \coprod (R \times R)$$

**dLC** = model of  $\Sigma_{0,+}$

$$[0, +] : 1 \coprod (dLC \times dLC) \rightarrow dLC$$

A **model morphism**  $m : (R, \rho) \rightarrow (S, \sigma) =$  monad morphism commuting with the module morphism:

$$\begin{array}{ccc} \Sigma(R) & \xrightarrow{\rho} & R \\ \Sigma(m) \downarrow & & \downarrow m \\ \Sigma(S) & \xrightarrow{\sigma} & S \end{array}$$

# Syntax

## Definition

Given a 1-signature  $\Sigma$ , its **syntax** is an initial object in its category of models.

**Question:** Does the syntax exist for every 1-signature?

**Answer:** No.

# Syntax

## Definition

Given a 1-signature  $\Sigma$ , its **syntax** is an initial object in its category of models.

**Question:** Does the syntax exist for every 1-signature?

**Answer:** No.

**Counter-example:** the 1-signature  $R \mapsto \mathcal{P} \circ R$ .

  
powerset endofunctor on Set

# Examples of 1-signatures generating syntax

- **(0,+) language:**

Signature:  $R \mapsto 1 \coprod (R \times R)$

Model:  $(R, \quad 0 : 1 \rightarrow R, \quad + : R \times R \rightarrow R)$

Syntax:  $(B, \quad 0 : 1 \rightarrow B, \quad + : B \times B \rightarrow B)$

- **lambda calculus:**

Signature:  $R \mapsto R' \coprod (R \times R)$

Model:  $(R, \quad abs : R' \rightarrow R, \quad app : R \times R \rightarrow R)$

Syntax:  $(\Lambda, \quad abs : \Lambda' \rightarrow \Lambda, \quad app : \Lambda \times \Lambda \rightarrow \Lambda)$

Can we generalize this pattern?

# Initial semantics for algebraic 1-signatures

Theorem [Hirschowitz & Maggesi 2007]

Syntax exists for any **algebraic 1-signature**, i.e. 1-signature built out of derivatives, products, disjoint unions, and the 1-signature  $R \mapsto R$ .

**Algebraic 1-signatures** correspond to the binding signatures described in [Fiore-Plotkin-Turi 1999]

(binding signature = lists of natural numbers specify n-ary operations, possibly binding variables)

**Question:** Can we enforce some equations in the syntax ?

e.g. **associativity** and **commutativity** of  $+$  for the differential  $\lambda$ -calculus.

# Quotients of algebraic 1-signatures

[AHLM CSL 2018]: notion of **quotients** of 1-signatures.

Theorem [AHLM CSL 2018]

Syntax exists for any "**quotient**" of algebraic 1-signature.

## Examples:

- a **commutative** binary operation
- application of the differential  $\lambda$ -calculus (original variant)

$\text{app} : \text{dLC} \times \text{FreeCommutativeMonoid}(\text{dLC}) \rightarrow \text{dLC}$

# Quotients of algebraic 1-signatures

[AHLM CSL 2018]: notion of **quotients** of 1-signatures.

Theorem [AHLM CSL 2018]

Syntax exists for any "**quotient**" of algebraic 1-signature.

## Examples:

- a **commutative** binary operation
- application of the differential  $\lambda$ -calculus (original variant)

$$\text{app} : \text{dLC} \times \text{FreeCommutativeMonoid}(\text{dLC}) \rightarrow \text{dLC}$$

... but not enough for the differential  $\lambda$ -calculus:

- **associativity** of  $+$
- **linearity** of the operations

# Table of contents

1. 1-Signatures and models based on monads and modules

**2. Equations**

3. Recursion

# Example: a commutative binary operation

## Specification of a binary operation

1-Signature:  $R \mapsto R \times R$

Model:  $(R, + : R \times R \rightarrow R)$

**What is an appropriate notion of model for a commutative binary operation ?**

# Example: a commutative binary operation

## Specification of a **commutative** binary operation

1-Signature:  $R \mapsto R \times R$

Model:  $(R, + : R \times R \rightarrow R)$  s.t.  $t + u = u + t$  (1)

**What is an appropriate notion of model for a commutative binary operation ?**

**Answer:** a monad equipped with a **commutative** binary operation

# Example: a commutative binary operation

## Specification of a **commutative** binary operation

1-Signature:  $R \mapsto R \times R$

Model:  $(R, + : R \times R \rightarrow R)$  s.t.  $t + u = u + t$  (1)

**What is an appropriate notion of model for a commutative binary operation ?**

**Answer:** a monad equipped with a **commutative** binary operation

Equation (1) states an equality between  $R$ -module morphisms:

# Equations

Given a 1-signature  $\Sigma$ , (e.g. binary operation:  $\Sigma(R) = R \times R$ )

a  $\Sigma$ -**equation**  $A \rightrightarrows B$  is a functorial assignment: e.g. commutativity:

$$R \mapsto \left( A(R) \rightrightarrows B(R) \right)$$

model of  $\Sigma$  (points to  $R$ )

parallel pair of module morphisms over  $R$  (points to  $A(R) \rightrightarrows B(R)$ )

$$R \mapsto \left( R \times R \xrightarrow[+\circ swap]{+} R \right)$$

A **2-signature** is a pair

$$(\Sigma, E)$$

1-signature (points to  $\Sigma$ )

set of  $\Sigma$ -equations (points to  $E$ )

**model of a 2-signature**  $(\Sigma, E)$ :

- a model  $R$  of  $\Sigma$
- s.t.  $\forall (A \rightrightarrows B) \in E$ , the two morphisms  $A(R) \rightrightarrows B(R)$  are equal

# Initial semantics for algebraic 2-signatures

**Algebraic** 2-signature:

Theorem

Syntax exists for any algebraic 2-signature.

Main instances of **elementary**  $\Sigma$ -equations  $A \Rightarrow B$ :

- $A =$  algebraic 1-signature    e.g.  $A(R) = R \times R$
- $B(R) = R$

# Initial semantics for algebraic 2-signatures

**Algebraic** 2-signature:

Theorem

Syntax exists for any algebraic 2-signature.

Main instances of **elementary**  $\Sigma$ -equations  $A \Rightarrow B$ :

- $A =$  algebraic 1-signature    e.g.  $A(R) = R \times R$
- $B(R) = R$

**Sketch of the construction of the syntax:**

Quotient the initial model  $R$  of  $\Sigma$  by the following relation:

$x \sim y$  in  $R(X)$     iff    for any model  $S$  of  $(\Sigma, E)$ ,  $i(x) = i(y)$

initial  $\Sigma$ -model morphism  $i : R \rightarrow S$

# Example: $\lambda$ -calculus modulo $\beta\eta$

The algebraic 2-signature  $(\Sigma_{\text{LC}\beta\eta}, E_{\text{LC}\beta\eta})$  of  $\lambda$ -calculus modulo  $\beta\eta$ :

$$\Sigma_{\text{LC}\beta\eta}(\mathbf{R}) := \Sigma_{\text{LC}}(\mathbf{R}) = (\mathbf{R} \times \mathbf{R}) \amalg \mathbf{R}'$$

**model of  $\Sigma_{\text{LC}}$**  = monad  $\mathbf{R}$  with module morphisms:

$$\text{app} : \mathbf{R} \times \mathbf{R} \rightarrow \mathbf{R} \qquad \text{abs} : \mathbf{R}' \rightarrow \mathbf{R}$$

**$\beta$ -equation:**  $(\lambda x.t) u = \underbrace{t[x \mapsto u]}_{\sigma_{\mathbf{R}}(t,u)}$

**$\eta$ -equation:**  $t = \lambda x.(t x)$

$$E_{\text{LC}\beta\eta} = \{ \beta\text{-equation}, \eta\text{-equation} \}$$

# Example: $\lambda$ -calculus modulo $\beta\eta$

The algebraic 2-signature  $(\Sigma_{\text{LC}\beta\eta}, E_{\text{LC}\beta\eta})$  of  $\lambda$ -calculus modulo  $\beta\eta$ :

$$\Sigma_{\text{LC}\beta\eta}(\mathbf{R}) := \Sigma_{\text{LC}}(\mathbf{R}) = (\mathbf{R} \times \mathbf{R}) \amalg \mathbf{R}'$$

**model of  $\Sigma_{\text{LC}}$**  = monad  $\mathbf{R}$  with module morphisms:

$$\text{app} : \mathbf{R} \times \mathbf{R} \rightarrow \mathbf{R} \quad \text{abs} : \mathbf{R}' \rightarrow \mathbf{R}$$

**$\beta$ -equation:**  $(\lambda x.t) u = t[\underbrace{x \mapsto u}_{\sigma_{\mathbf{R}}(t,u)}]$

**$\eta$ -equation:**  $t = \lambda x.(t x)$

$$\begin{array}{ccccc}
 & \sigma_{\mathbf{R}} & & & \\
 \mathbf{R}' \times \mathbf{R} & \xrightarrow{\quad} & \mathbf{R} & & \\
 \text{abs} \times \mathbf{R} \searrow & & \nearrow \text{app} & & \\
 & \mathbf{R} \times \mathbf{R} & & & 
 \end{array}$$

 & \mathbf{R}' & & & 
 \end{array}$$

$$E_{\text{LC}\beta\eta} = \{ \beta\text{-equation}, \eta\text{-equation} \}$$

# Example: fixpoint operator

Definition [AHLM CSL 2018]

A **fixpoint operator** in a monad  $R$  is a module morphism  $\text{fix}: R' \rightarrow R$  s.t. for any term  $t \in R(X \coprod \{\diamond\})$ ,  $\text{fix}(t) = t[\diamond \mapsto f(t)]$

**Intuition:**  $\text{fix}(t) := \text{let rec } \diamond = t \text{ in } \diamond$

Proposition [AHLM CSL 2018]

**Fixpoint operators** in  $LC_{\beta\eta}$  are in one to one correspondance with fixpoint combinators (i.e.  $\lambda$ -terms  $Y$  s.t.  $t(Yt) = Yt$  for any  $t$ ).

# Example: fixpoint operator

Definition [AHLM CSL 2018]

A **fixpoint operator** in a monad  $R$  is a module morphism  $\text{fix}: R' \rightarrow R$  s.t. for any term  $t \in R(X \coprod \{\diamond\})$ ,  $\text{fix}(t) = t[\diamond \mapsto \text{fix}(t)]$

**Intuition:**  $\text{fix}(t) := \text{let rec } \diamond = t \text{ in } \diamond$

Proposition [AHLM CSL 2018]

**Fixpoint operators** in  $LC_{\beta\eta}$  are in one to one correspondance with fixpoint combinators (i.e.  $\lambda$ -terms  $Y$  s.t.  $t(Yt) = Yt$  for any  $t$ ).

Algebraic 2-signature  $(\Sigma_{\text{fix}}, E_{\text{fix}})$  of a fixpoint operator:

$$\Sigma_{\text{fix}}(R) := R' \qquad E_{\text{fix}} = \left\{ \begin{array}{ccc} & \xrightarrow{\text{fix}(t)} & \\ R' & & R \\ & \xleftarrow{t[\diamond \mapsto \text{fix}(t)]} & \\ & t & \end{array} \right\}$$

# Combining algebraic 2-signatures

Algebraic 2-signatures can be combined:

fixpoint operator

$\lambda$ -calculus modulo  $\beta\eta$

$(\Sigma_{\text{fix}}, E_{\text{fix}})$

+

$(\Sigma_{\text{LC}\beta\eta}, E_{\text{LC}\beta\eta})$

=

$(\Sigma_{\text{fix}} \amalg \Sigma_{\text{LC}\beta\eta}, E_{\text{fix}} \cup E_{\text{LC}\beta\eta})$

$\lambda$ -calculus modulo  $\beta\eta$  with an explicit fixpoint operator

# Example: free commutative monoid

An algebraic 2-signature  $(\Sigma_{\text{mon}}, E_{\text{mon}})$  for the free commutative monoid

monad:

$$\Sigma_{\text{mon}}(\mathbf{R}) := 1 \amalg (\mathbf{R} \times \mathbf{R})$$

**model of**  $\Sigma_{\text{mon}}$  = monad  $\mathbf{R}$  with module morphisms:

$$0 : 1 \rightarrow \mathbf{R} \quad + : \mathbf{R} \times \mathbf{R} \rightarrow \mathbf{R}$$

# Example: free commutative monoid

An algebraic 2-signature  $(\Sigma_{\text{mon}}, \mathbf{E}_{\text{mon}})$  for the free commutative monoid

monad:

$$\Sigma_{\text{mon}}(\mathbf{R}) := 1 \amalg (\mathbf{R} \times \mathbf{R})$$

**model of**  $\Sigma_{\text{mon}}$  = monad  $\mathbf{R}$  with module morphisms:

$$0 : 1 \rightarrow \mathbf{R} \quad + : \mathbf{R} \times \mathbf{R} \rightarrow \mathbf{R}$$

4 elementary  $\Sigma$ -equations:

$$\begin{array}{ccc} R & \begin{array}{c} \xrightarrow{0+t} \\ \xleftarrow{t} \end{array} & R \end{array}$$

$$\begin{array}{ccc} R \times R \times R & \begin{array}{c} \xrightarrow{(s+t)+u} \\ \xleftarrow{s+(t+u)} \end{array} & R \\ s, t, u & & \end{array}$$

$$\begin{array}{ccc} R & \begin{array}{c} \xrightarrow{t+0} \\ \xleftarrow{t} \end{array} & R \end{array}$$

$$\begin{array}{ccc} R \times R & \begin{array}{c} \xrightarrow{s+t} \\ \xleftarrow{t+s} \end{array} & R \\ s, t & & \end{array}$$

# Our target: dLC

## Syntax of the *differential $\lambda$ -calculus*:

### *Differential $\lambda$ -terms*

$$\begin{array}{lcl} s, t & ::= & x \\ & | & \lambda x. t \\ & | & s \ t \\ & | & Ds \cdot t \\ & | & s + t \\ & | & 0 \end{array} \quad \left. \begin{array}{l} \\ \\ \\ \\ \end{array} \right\} \begin{array}{l} \lambda\text{-calculus} \\ \\ \\ \text{free commutative monoid} \end{array}$$

and (bi)linearity of operations with respect to +:

$$\lambda x. (s + t) = \lambda x. s + \lambda x. t \quad \dots$$

# Algebraic 1-signature for dLC

Proposition [AHLM CSL 2018]

**Fixpoint operators** in  $\text{LC}_{\beta\eta}$  are in one to one correspondance with fixpoint combinators (i.e.  $\lambda$ -terms  $\mathbf{Y}$  s.t.  $t (\mathbf{Y}t) = \mathbf{Y}t$  for any  $t$ ).

Initiality of  $\text{LC}_{\beta\eta+\text{fix}}$   $\Rightarrow$  monad morphism  $\text{LC}_{\beta\eta+\text{fix}} \rightarrow \text{LC}_{\beta\eta}$

# Example: Computing the size of a term

$\lambda$ -calculus monad

$$\begin{array}{lcl} s_X & : & \text{LC}(X) \rightarrow \mathbb{N} \\ & & t \mapsto \text{number of constructors in } t \end{array}$$

$$\begin{aligned} s(x) &= 0 \\ s(\lambda x.x) &= 1 \\ s((\lambda x.x) y) &= 2 \end{aligned}$$

.. as a monad morphism  $s : \text{LC} \rightarrow \mathbb{N}$

# Example: Computing the size of a term

$\lambda$ -calculus monad

$s_X : \text{LC}(X) \rightarrow \mathbb{N}$   
 $t \mapsto$  number of constructors in  $t$

$$\begin{aligned}s(x) &= 0 \\ s(\lambda x.x) &= 1 \\ s((\lambda x.x) y) &= 2\end{aligned}$$

~~.. as a monad morphism~~  $s : \text{LC} \rightarrow \mathbb{N}$

$\mathbb{N}$  is not a monad !

# Example: Computing the size of a term

$\lambda$ -calculus monad

$s_X : LC(X) \rightarrow \mathbb{N}$   
 $t \mapsto$  number of constructors in  $t$

$$\begin{aligned}s(x) &= 0 \\ s(\lambda x.x) &= 1 \\ s((\lambda x.x) y) &= 2\end{aligned}$$

~~.. as a monad morphism~~  $s : LC \rightarrow \mathbb{N}$

$\mathbb{N}$  is not a monad !

**Solution** [CSL AHLM 2018]:

1. define  $f : LC \rightarrow C$  by recursion

continuation monad  $C(X) = \mathbb{N}^{\mathbb{N}^X}$

2. deduce  $s : LC \rightarrow \mathbb{N}$

# Example: Computing the size of a term

$\lambda$ -calculus monad

$$s_X : \text{LC}(X) \rightarrow \mathbb{N}$$

$t \mapsto$  number of constructors in  $t$

$$\begin{aligned} s(x) &= 0 \\ s(\lambda x.x) &= 1 \\ s((\lambda x.x) y) &= 2 \end{aligned}$$

~~.. as a monad morphism~~  $s : \text{LC} \rightarrow \mathbb{N}$

$\mathbb{N}$  is not a monad !

**Solution** [CSL AHLM 2018]:

1. define  $f : \text{LC} \rightarrow \mathbf{C}$  by recursion

2. deduce  $s : \text{LC} \rightarrow \mathbb{N}$

continuation monad  $\mathbf{C}(X) = \mathbb{N}^{(\mathbb{N}^X)}$

assigns an arbitrary size to each variable

**Intuition:**  $f_X : \text{LC}(X) \rightarrow \mathbb{N}^{(\mathbb{N}^X)}$

$\xRightarrow{\text{uncurry}}$

$$g : \text{LC}(X) \times \mathbb{N}^X \rightarrow \mathbb{N}$$

$$g(x, u) = u(x)$$

# Example: Computing the size of a term

$\lambda$ -calculus monad

$$s_X : \text{LC}(X) \rightarrow \mathbb{N}$$

$t \mapsto$  number of constructors in  $t$

$$\begin{aligned} s(x) &= 0 \\ s(\lambda x.x) &= 1 \\ s((\lambda x.x) y) &= 2 \end{aligned}$$

~~.. as a monad morphism~~  $s : \text{LC} \rightarrow \mathbb{N}$

$\mathbb{N}$  is not a monad !

**Solution** [CSL AHLM 2018]:

1. define  $f : \text{LC} \rightarrow \mathbf{C}$  by recursion

2. deduce  $s : \text{LC} \rightarrow \mathbb{N}$

continuation monad  $\mathbf{C}(X) = \mathbb{N}^{(\mathbb{N}^X)}$

assigns an arbitrary size to each variable

**Intuition:**  $f_X : \text{LC}(X) \rightarrow \mathbb{N}^{(\mathbb{N}^X)}$

$\xRightarrow{\text{uncurry}}$

$g : \text{LC}(X) \times \mathbb{N}^X \rightarrow \mathbb{N}$

$$g(x, u) = u(x)$$

$$s(t) = g(t, (x \mapsto 0))$$

variables are of size 0

# Conclusion

## **Summary of the talk:**

- notion of 1-signature and models based on monads and modules
- 2-signature = 1-signature + set of equations
- *algebraic* 2-signatures generate a syntax, e.g. differential  $\lambda$ -calculus.

Main theorems formalized in Coq using the UniMath library.

## **Future work:**

- add the notion of reductions;
- extend our work to simply typed syntaxes.

# Conclusion

## Summary of the talk:

- notion of 1-signature and models based on monads and modules
- 2-signature = 1-signature + set of equations
- *algebraic* 2-signatures generate a syntax, e.g. differential  $\lambda$ -calculus.

Main theorems formalized in Coq using the UniMath library.

## Future work:

- add the notion of reductions;
- extend our work to simply typed syntaxes.

Thank you!
